

Homework 12:

Feature Complete Implementation

Warm Up Due: Monday May 04, 2026 11:59 PM on Courseworks. Grace period until 8AM the following day.

Main Due: Friday May 08, 2026 11:59 PM on Courseworks. No grace period.

Note:

This is the last submission where you can get feedback from your TA before submitting the final project.

Warm Up:

1. Group

- What feedback did you get from your TA on your graphic design?
- What's something good about your graphic design from HW11?
- What are the things your TA said you still need to work on with regard to what you need to continue to work on (for graphic design or anything else?)

2. **Group.** Job assignments: Some group members may focus on graphic design and some may focus on continuing technical implementation. List the roles you plan to have and the names of the people assigned to them. If you're a solo group, list what technical implementation you plan to do this week.

What to Submit:

- A PDF with the answers to #1 and #2.

Although this work is all being done collectively, everyone in the group must turn in the work individually. (You may turn in identical work)

Main (Individual):

This final project requires you to turn in an 8-12-minute video where you demonstrate a new user using your application. However, it won't be an actual new user using it, you will simulate the actions, thoughts, and behaviors of a new user. Because the learning experience takes about 10 minutes, the demo will take about 10 minutes.

Overall, your goal is to convince your TA that you have truly built an experience with the user at the center of the process. That means that you must understand the user well enough to explain what they will do, think, and react. It also means you know your application well enough to know what parts of the learning or quiz people will find difficult and probably get wrong. It's not realistic to think a user learn new material and not stumble over anything.

Here is a script you *should* follow:

- **Introduce the goal on Home Screen**
 - Start the video showing the app's Home Screen.
 - Introduce the User and the purpose of the app.
 - *"This is Lipreading. An app that teaches how to recognize the most common and confusing sound when learning to lip read."* This example introduction has a purpose, but doesn't explicitly say who the user is, which is okay... it's fairly general.
 - *"This is Learning Lighting. An introduction to new photographers learning to place lights."* This example introduction has a purpose and a user – "new photographers". Still pretty general, but it's better.
- **Demo from user perspective.** Then start using the app exactly as you intend a user to. As you go through every screen, think out loud
 - Read aloud everything that a real user would read.
 - Think aloud everything a real user would think.
 - Click everything a real user would click.
 - Express the emotions a real user would feel.
 - If you think a real user would make a mistake on the quiz, you can make a simulated mistake on the quiz.
 - You must have at least one point where the user makes a mistake (and recovers from it) in the learning or quiz.
- **Reiterate purpose on home screen**
 - End the video by going back to the homepage and reiterating the purpose
 - "That's (site name). A site to teach you _____(purpose)_____."

Will we not watch (or grade) the video past the 10-minute mark.

For the final project, you will turn in a video like the one described above (in addition to your code). This assignment is a chance for you to get feedback on your final system and the video. We highly recommend you get feedback from your TA on your video.

Plan to iterate on the video. Whenever I shoot a video, I plan to do three takes – the first take is always terrible – I stutter, I get lost, I ramble, etc. The second take is better – but will often have some mistakes. The third take will be smoother and generally get across what I want to say. Not perfect, but no embarrassing flaws.

We will grade this assignment based on whether it provides a reasonable feature complete system, and whether the video reasonably shows you understand the user's perspective. However, we understand that you may have work to continue on before the final submission, so we will grade based on your efforts to make progress towards addressing your TA's feedback and coming close to a feature complete application.

What to submit:

1. **Individual.** A link to a YouTube video of your narrated user simulation demo. If you are in a team, every member of the team must turn in a separate video with their own video and narration of the user simulation. The individual's videos can be from a shared code base.
2. **Individual (optional but highly recommended).** Turn in a copy of your video and your code for the final project. You can update this later as you continue to iterate on your project, but at least this way you will avoid getting a zero on the final submission if you are late or have some other problem. We grade the last submission we get from you (*that was submitted before the deadline*).
